

Open Cloud

Cloud on Your Terms

Take advantage of the benefits of cloud - delivered through a transparent, data-sovereign model. Open Sentia Cloud is an open platform provided from Sentia's local data centers. The infrastructure is precisely tailored to your workloads and designed to operate under strict data control requirements, supporting your need for compliance, clear documentation, and full transparency regarding the location of your data. The modular architecture is transparent and highly flexible, enabling a high degree of data sovereignty while adapting seamlessly to your operational needs.

Digital Freedom of Choice

Geopolitical uncertainty is increasing the need for greater independence from the primary hyperscalers, while organizations and regulators are simultaneously imposing stricter compliance requirements. The platform is built on open-source technology and designed and managed by our certified experts. It is ideally suited for workloads involving sensitive data that require high levels of control and sovereignty - such as financial systems, healthcare platforms, and public-sector applications. The infrastructure also supports custom-built or legacy applications that require specialized configurations. With Open Sentia Cloud, you gain digital independence and access to a wide range of benefits:

DATA SOVEREIGNTY

Avoid vendor lock-in with major technology vendors leveraging a local, data-sovereign, and open cloud platform.

FLEXIBILITY

Choose between resource pool or capacity tiers with an agile infrastructure model that aligns with your organization's needs.

SCALABILITY

Access resources on demand and scale without limitation as business requirements and market demands evolve.

COST OPTIMIZATION

Avoid large-scale refactoring projects and pay only for actual consumption using modern governance mechanisms and precise metering.

Platform Capabilities

- ✓ Flexible consumption-based pricing models
- ✓ Hybrid cloud-ready
- ✓ Optimized for cost efficiency
- ✓ Governance and transition framework
- ✓ Self-service portal
- ✓ 24/7 Monitoring
- ✓ ITIL-based support framework and Service Desk
- ✓ Patch, backup, and disaster recovery management
- ✓ Multiple sovereign availability zones
- ✓ Advanced network management
- ✓ Infrastructure as Code support
- ✓ Kubernetes compatible
- ✓ Integrated firewall and DDoS protection

Open Cloud

A Flexible Foundation

Sentia Open Cloud is delivered in two operational models, depending on your resource and management requirements. Choose extensive self-service capabilities, or let Sentia manage resource allocation so you can focus confidently on your core business. Regardless of the model, both options are delivered from Sentia's Danish data centers, designed to meet GDPR and your compliance standards.

Pay-as-You-Go

Leverage **flexible VM sizing** and tailor your infrastructure to your business and resource requirements with scalable configurations.

Avoid major capacity commitments and underutilized resources. Pay only for **your actual resource consumption** and gain full transparency into your operating costs.

Configured in CPU, RAM, and storage tiers, you gain access to versatile service levels and VM standards that form the foundation of a **scalable infrastructure**.

Reserved Resource Pool

Gain **full flexibility** in customizing your virtual machines. Configure them exactly to your specifications and maintain precise control over your resource composition.

Benefit from the **dynamic operating cost model**, paying only for your expected consumption over a committed term.

With an **agile platform**, you can define your resource pool configuration down to the exact allocation of CPU, RAM, and storage.

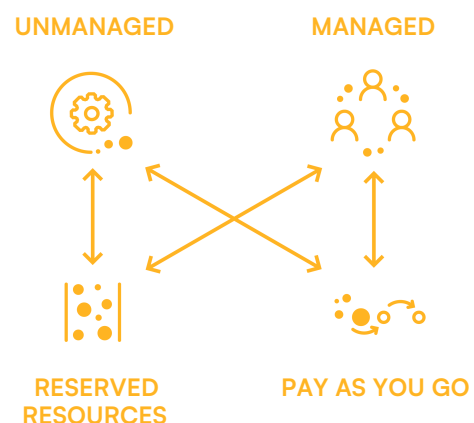

Fully Managed or Self-Service?

The choice is yours. Manage the entire environment yourself, or rely on Sentia's response team to provide 24/7 contingency and handle complex governance, operations, and administrative tasks - including continuous monitoring and logging, identity and access management, along with incident and change management.

No Two Organizations Are Alike

Gain access to our proven transition models and the combined expertise of our specialists. Based on your specific situation and strategic objectives, we assess your overall IT landscape and recommend the optimal operating model and composition for your organization.

We systematically analyze what is required at every step of the journey toward your future state, resulting in a detailed roadmap that includes the right transformation strategies for your workloads.

STREAMLINE YOUR DIGITAL INFRASTRUCTURE

Open Cloud

Cloud Foundation: The Link Between Cloud and Your Business

Built on decades of experience in digital transformation and large-scale IT operations, the Cloud Foundation framework ensures that your infrastructure meets the highest standards and enables more controlled, consistent, secure, and faster adoption of cloud services across your organization. Your cloud foundation is designed according to well-architected principles - covering reliability, security and compliance, performance efficiency, operational excellence, and cost optimization. With robust operational models embedded, you can confidently execute your cloud strategy successfully.

Operations Management

Procedure operations and processes, workload management, and observability

Cost Management

License management, architecture optimization, and consumption control

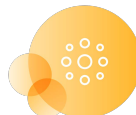

Cloud Security

Governance, risk, and compliance management, including identity and access management

Business Continuity

Disaster recovery management, performance and vulnerability management, and penetration testing

Application Services

Performance management and application continuity

Platform Management

End-to-end service management and advisory services

Get Started with Sentia Insight

Leverage our expertise to establish a professional cloud infrastructure that evolves with your business. Through a careful assessment and analysis of your workloads and capacity requirements - combined with recommendations for the most efficient infrastructure - you can achieve the right balance between digital sovereignty and data governance as part of your cloud strategy. We provide you with a comprehensive overview of your environment and recommend the right plan, aligned with your business objectives and implemented according to best practices.
